How to download an entire website for offline usage (using wget)

Here is a simple step to downloading an entire website and making it available offline using wget.

Wget is a command-line **utility for retrieving files** using HTTP, HTTPS and FTP protocols.

How to Install Wget

Wget comes with most Unix/Linux systems, but here is how you get it in case you were left out.

Use the command →

On Mac:

```
brew install wget
```

On Linux:

```
sudo apt-get install wget
```

Using Wget to download the website:

Enter this command on your terminal

```
wget -m -p -E -k -np https://example.com
```

The options explained:

<code>-m, --mirror</code>	Turns on recursion and time-stamping, sets infinite recursion depth, and keeps FTP directory listings.
<code>-p, --page-requisites</code>	Get all images, etc. needed to display HTML page.
<code>-E, --adjust-extension</code>	Save HTML/CSS files with .html/.css extensions.
<code>-k, --convert-links</code>	Make links in downloaded HTML point to local files.
<code>-np, --no-parent</code>	Dont ascend to the parent directory when retrieving recursively. This guarantees that only the files below a certain hierarchy will be downloaded. Requires a slash at the end of the directory, e.g. example.com/foo/.
